

## Internet Security Settings Adjustments for Viewing Blogs in MS Internet Explorer

Updated Dec. 23, 2008

If your Internet browser crashes when you attempt to open a blog, do the following to enable viewing:

- Open Internet Explorer and go to **Tools/Internet Options**
- Choose the **Security tab**
- You will see four content zones, the first being “**Internet**” which is already chosen.
- Click **Custom Level** and a Security settings window opens
- Scroll down to **Miscellaneous: Access data sources across domains** and choose **Enable** and **click OK and Yes** when the prompt window appears.
- Click the “**Restricted Sites**” content zone
- Click **Custom Level** and a Security settings window opens
- Scroll down to **Miscellaneous: Access data sources across domains** and choose **Enable** and **click OK and Yes** when the prompt window appears.

Now you should be able to view the blog without it crashing/freezing your Internet Explorer browser.
